

Internet Banking System – Requirements Document

This project is a web application that allows individual users to perform banking transactions securely over the internet. The goal of the system is to enable users to carry out basic banking operations (login, balance inquiry, money transfer, account history tracking, etc.) easily, securely, and quickly.

General Features

- Users log into the system using their registered email addresses and passwords.
- Passwords must be at least 8 characters long and include uppercase letters, lowercase letters, numbers, and special characters.
- If login attempts fail, the system displays an appropriate error message to the user.
- After 3 unsuccessful login attempts, the account is temporarily locked for 10 minutes.

Money Transfer Feature

- The user can transfer money to another account via the 'Send Money' menu.
- The IBAN field must be 26 characters long, and the system must reject invalid IBAN formats.
- The transfer amount field accepts only positive numeric values.
- Once the transfer is confirmed, the system displays a 'transaction successful' message and updates the balance instantly.
- Successful transfers are automatically added to the transaction history.

Additional Requirements

- All transactions must be carried out over SSL.
- If no activity occurs for 5 minutes after login, the session must automatically expire.
- The user should be able to view their last 10 transactions on the 'Account History' page.

Sample User Story

As a user, I want to log in with valid credentials and view my account balance so that I can easily check my account status.
