

SOFTWARE TESTING

MASTERCLASS

Software Development Life Cycle

Basics of Software Testing

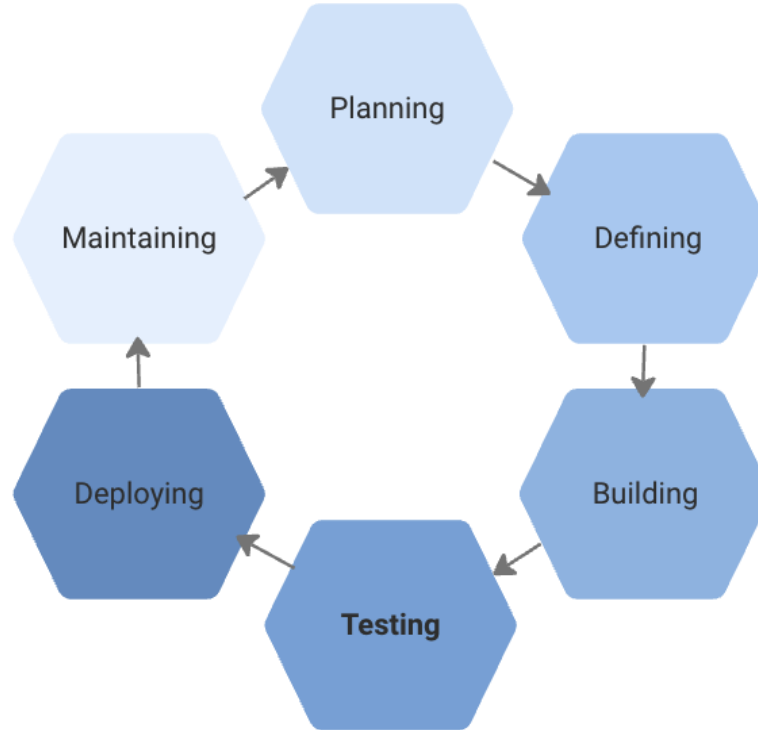

Software Development Life Cycle

The Software Development Life Cycle (SDLC) is a term used to describe the process of delivering software to a customer through a series of steps. This process aims to produce high-quality software at the lowest cost and in the shortest time possible.

Basics of Software Testing

Software Development Life Cycle

Basics of Software Testing

Software Development Life Cycle

Planning: During the planning phase, the team answers the question, "What do we want?"

Identification of the
system for
development

Feasibility
assessment

Creation of a
project plan

Basics of Software Testing

Software Development Life Cycle

- Collaboration with stakeholders: Testers collaborate with stakeholders, such as project managers, developers, and business analysts.
- Test strategy and planning: Testers contribute to the development of a test strategy that outlines the overall approach to testing.
- Test effort estimation: Testers assist in estimating the time and resources required for the testing activities
- Risk analysis: Testers participate in risk analysis sessions to identify potential risks associated with the software and plan mitigation strategies.

Software Development Life Cycle

- Reviewing and analyzing requirements: Testers analyze the requirements and specifications to identify any ambiguities, inconsistencies, or potential issues.
- Developing testable requirements: Testers help to create testable requirements by ensuring that they are clear, concise, and measurable.
- Test effort estimation: Testers assist in estimating the time and resources required for the testing activities
- Risk analysis: Testers participate in risk analysis sessions to identify potential risks associated with the software and plan mitigation strategies.

Basics of Software Testing

Software Development Life Cycle

Building: Developers write the actual code, transforming the documents from the previous phase into the actual system.

Development of IT
infrastructure

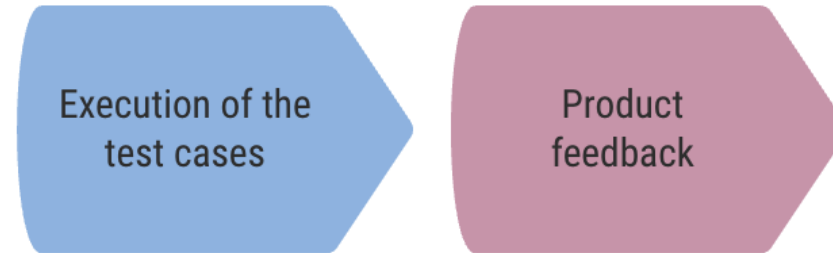

Development of the
database and code

Basics of Software Testing

Software Development Life Cycle

Testing: In the testing phase, the team asks, "Did we get what we want?"

Deployment: In this phase, the product is shared with customers and potential users.

Basics of Software Testing

Software Development Life Cycle

Maintenance: The team focuses on refining and improving the deployed software

Basics of Software Testing

Software Development Life Cycle

In the IT world, delivered software is like a finished "dish." At the end of the Software Development Life Cycle, you can deliver the end product to customers.
